

Streamline the Process of Scheduling and Routing

Every supplier knows the difficulty with efficiently scheduling the delivery of your customer's orders. Dispatch and delivery is a time-consuming task vital to your day-to-day operation, but is one of the most difficult operations to manage. Did you know that there is a better and easier way?

RoadWizard is an easy to use, desktop decision support tool that simplifies dispatch planning for companies with small to medium sized truck fleets, enabling you to reduce transportation costs, increase driver efficiency, and improve customer service.

Generate Optimal Delivery Schedules

RoadWizard is designed to automate your routing and scheduling process using your customer data directly from your business system. The software enables your warehouse manager to schedule delivery routes as soon as orders are picked from the business system.

RoadWizard provides a visual map of your deliveries by truck, enabling you to make informed decisions about which truck will deliver what orders where and when. You have the flexibility of changing your work rules to create a different solution, allowing you to determine the best combination of deliveries per truck based on customer requirements and efficient operations.

Improve Customer Satisfaction

RoadWizard allows management to have greater control over the delivery fleet. Imagine being able to tell your customer precisely when a delivery will show up when he calls. With an understanding of when and where a truck should be at any given point, wasted time will be identified and then decisions can be made to eliminate it. This level of control reduces driver labor, dispatch labor, and fleet operating costs.

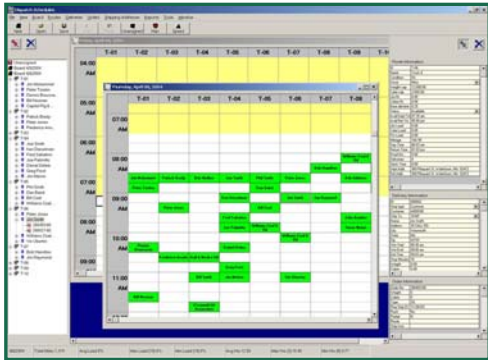

With Microsoft MapPoint, RoadWizard creates driving directions and maps. It can estimate the times and distances for each leg of a given truck's journey, giving you control over your delivery fleet. The printable and automatically generated maps are detailed, labeled for each stop, and feature a colored route line that simplifies getting to your destination.

A Solution for Every Business

RoadWizard is integrated with NxTrend SX.enterprise, Microsoft Great Plains, Navision, FACTS, and other ERP systems, making it automatic to retrieve the orders from the business system for scheduling, further reducing time spent by the dispatcher. RoadWizard is the solution to increase efficiency for your dispatch and delivery needs.

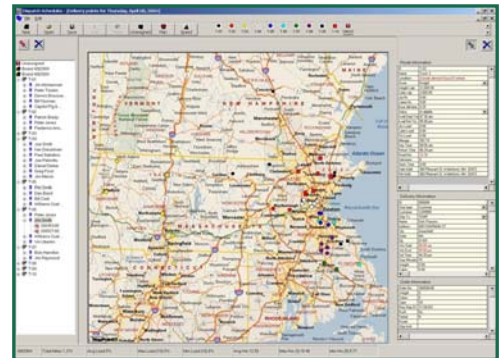

Why RoadWizard?

RoadWizard shows each delivery arranged on a daily grid with the timeline running down the left and the trucks displayed in columns across the top. Each green box is a scheduled delivery. They can be dragged around to different time slots, different trucks, or different days. The information panel on the right provides details on each route, delivery, and order. The tree panel on the left provides a condensed means to see where everything is.

RoadWizard provides a birds-eye view of what deliveries all the trucks are covering in a given day. Each delivery is color coded by truck and each delivery can be reassigned right on this screen. Unassigned deliveries show up with a question mark and can also be assigned with easy geographical reference right at your fingertips. All maps are displayed utilizing Microsoft's MapPoint, which provides richly detailed and user-friendly interface.

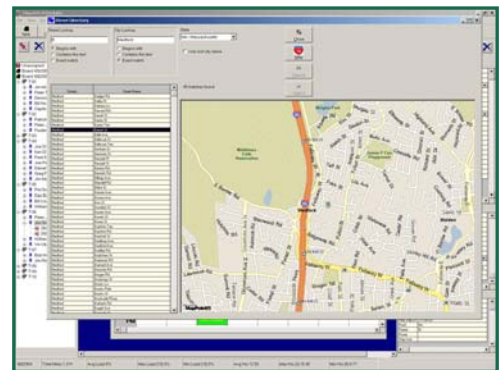

RoadWizard provides a map screen that shows the actual planned routing for a given truck. Routing manifests can be printed that provide directions, orders for each stop, and instructions.

RoadWizard contains a useful electronic street directory that is a handy tool that can be used to resolve misspellings and

addressing errors from orders within your business system. These problems get resolved before the trucks leave the warehouse so that your drivers stay on schedule to meet customer requirements.

RoadWizard has an "Assigned List" screen that provides a quick reference list of planned stops. The list is easily re-sorted by clicking on any of the columns on top.
