

bizLinx™ Mobile

Get product and account information delivered to your handheld device on the road!

Imagine having access to your valuable inventory, customer and sales account information everywhere you go. Now, much of the bizLinx eSales Center capabilities available over the Internet are today available via a "wireless device" using bizLinx Mobile. BizLinx Mobile is a set of applications for the Palm operating system that delivers the following to you:

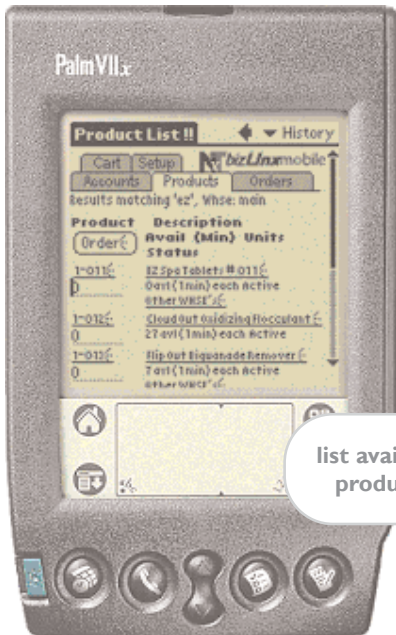

- On Line Order Entry
- Product Information
- Customer Account Information
- Order Status and History

NxTrend bizLinx Mobile is uniquely designed with the distributor in mind. The success of the NxTrend bizLinx Mobile product lies in its ability to get the right information into the right hands at the right time, something that other technology companies ignore. bizLinx Mobile processes information online in real time allowing you to work faster in the field to get new orders over your competition. For example, you want ordering information about price and availability, customer statements, sales histories, and important customer marketing information delivered wirelessly in real time so that your sales people can respond to customer needs faster than their competitors. bizLinx Mobile is the perfect solution.

bizLinx Mobile allows a distributor's employees or a distributor's customers to stay connected to their office and handle critical business needs without having to access a computer. This wireless application operates on a PDA and provides the capability to:

- access general account information (terms; days to pay; \$ on order; AR buckets, and open invoices). Security limits the distributor's customer to only being able to access their own accounts.
- search for product information by product, category, keyword, description and to show the status and availability.
- place orders by adding to a shopping cart. Users can perform order searches, drill down to a specific order and copy line items to the shopping cart.
